

Signal Tower

Mobile Towers are on the rise in HacksVille and there are N such mobile towers. Each mobile tower is named according to its position in the 2D plane of HacksVille i.e. $(A[i], B[i])$ is the position of the i^{th} tower. The city due to its growing power needs, is not able to power all the mobile towers and it can power only a set of towers between a range, say $[L..R]$ (both inclusive).

All the Mobile Towers are monitored by a wireless control room. For the controller room to connect to all the active mobile towers, it has to position itself such that the sum of its distance to all the active mobile towers (S) is minimized.

If the wireless control room is positioned at (X, Y) . Then, its distance to the mobile tower i is given by

$\max(|X-A[i]|, |Y-B[i]|)$ where $|x|$ means absolute value of x .

Input Format

The first line contains two integers, N and Q separated by a space where Q is the indices of the mobile towers that are active at different points of time.

The second line contains integers A_1 to A_N all separated by a single space.

The third line contains integers B_1 to B_N all separated by a single space where (A_i, B_i) is the position of the i^{th} tower. Q lines follow each containing the range L and R separated by a single space which are the range of towers that are active.

```
N Q
A1 A2 ... An
B1 B2 ... Bn
L1 R1
L2 R2
...
LQ RQ
```

Constraints

$1 \leq N \leq 100000$

$1 \leq Q \leq 100000$

$-1000000000 \leq A[i], B[i] \leq 1000000000$

$1 \leq L_i \leq R_i \leq N$

Output Format

Your task is to find the optimal position and print its cumulative distance (S) to all the mobile towers.

```
S1
S2
...
SQ
```

Error of at most 10^{-3} is tolerated.

Sample Input

```
4 2
1 2 0 1
4 3 1 1
1 4
3 4
```

Sample Output

5.0000000
1.0000000

Explanation

In the testcase, there are 4 mobile towers in the city of HacksVille positioned at (1,4), (2,3), (0,1) and (1,1)

At time T1, all the mobile towers are active (indicated by $L = 1$ and $R = 4$). So, one possible location for the mobile control room would be at

1.5 2.5

The cumulative distance (S) is

$$\begin{aligned} &= \max(|1.5-1|, |2.5-4|) + \max(|1.5-2|, |2.5-3|) + \max(|1.5-0|, |2.5-1|) + \max(|1.5-1|, |2.5-1|) \\ &= \max(0.5, 1.5) + \max(0.5, 0.5) + \max(1.5, 1.5) + \max(0.5, 1.5) \\ &= 1.5 + 0.5 + 1.5 + 1.5 \\ &= 5.0 \end{aligned}$$

At time T2, only the mobile towers indexed between 3 and 4 ($L = 3$ and $R = 4$) are indexed. So, one possible location for the mobile control room would be,

1 1

The cumulative distance (S) is

$$\begin{aligned} &= \max(|1-0|, |1-1|) + \max(|1-1|, |1-1|) \\ &= \max(1, 0) + \max(0, 0) \\ &= 1.0 \end{aligned}$$
