Attending Workshops

A student signed up for n workshops and wants to attend the maximum number of workshops where no two workshops overlap. You must do the following:

Implement 2 structures:

- 1. struct Workshop having the following members:
 - The workshop's start time.
 - The workshop's duration.
 - The workshop's end time.
- 2. struct Available Workshops having the following members:
 - An integer, *n* (the number of workshops the student signed up for).
 - An array of type *Workshop* array having size *n*.

Implement 2 functions:

- 1. $Available_Workshops*initialize (int start_time[], int duration[], int n)$ Creates an $Available_Workshops$ object and initializes its elements using the elements in the $start_time[]$ and duration[] parameters (both are of size n). Here, $start_time[i]$ and duration[i] are the respective start time and duration for the i^{th} workshop. This function must return a pointer to an $Available\ Workshops$ object.
- int CalculateMaxWorkshops(Available_Workshops* ptr)
 Returns the maximum number of workshops the student can attend—without overlap. The next workshop cannot be attended until the previous workshop ends.

Note: An array of unknown size (n) should be declared as follows:

DataType* arrayName = new DataType[n];

Input Format

Input from stdin is handled by the locked code in the editor; you simply need to write your functions to meet the specifications of the problem statement above.

Constraints

- $1 \le N \le 10^5$
- $0 \leq start_time_i \leq 10^3$
- $0 \leq duration_i \leq 10^3$

Output Format

Output to stdout is handled for you.

Your initialize function must return a pointer to an Available Workshops object.

Your *CalculateMaxWorkshops* function must return maximum number of non-overlapping workshops the student can attend.

Sample Input

6 1 3 0 5 5 8 1 1 6 2 4 1

Sample Output

CalculateMaxWorkshops should return 4.

Explanation

The first line denotes n, the number of workshops.

The next line contains n space-separated integers where the i^{th} integer is the i^{th} workshop's start time. The next line contains n space-separated integers where the i^{th} integer is the i^{th} workshop's duration.

The student can attend the workshops 0, 1, 3, and 5 without overlap, so *CalculateMaxWorkshops* returns 4 to main (which then prints 4 to stdout).
