Ruby Tutorial - Object Method Parameters

A method may take zero or more parameters as input. To demonstrate this, we look at the asserts we use on HackerRank. Sometimes, we have to check whether a given number a is within the range b and c (where $b \le c$, and both inclusive).

Three variables a, b, and c are already defined. Your task is to write code that checks whether a is within the range of b and c by calling the method `range?` (which we have defined for you as a method for this example) on a and passing b and c as arguments.

Hint

```
a.range?(b, c)
```

or

```
return a.range?(b, c)
```

or

```
a.range? b, c
```

or

```
return a.range? b, c
```
